Form 2515F

PRINTED IN U.S.A.

FOREWORD

This Service and Parts Manual has been prepared for your information and guidance. It is given to you as confidential matter.

It contains all data, drawings, and wiring diagrams for the servicing of Kalart Victor 16mm Sound Motion Picture Projectors - Model 70 Series. The Manual is organized so that data appears on left hand pages with corresponding drawings on right hand pages, opposite.

On pages that show general assemblies, a column will be found directly to the right of nomenclature giving page number of assembly breakdown.

You will note that various parts are NOT numbered. These are factory operations and have been purposely excluded for reasons of simplification.

Read and observe the following so there will be no misunderstanding in regard to the Kalart Victor Service Policy:

- A. All parts orders and correspondence pertaining to service should be sent directly to our Service Manager, and not included in correspondence for other departments.
- B. When ordering, the number of each part and its description should be given, as well as the model and serial number of equipment, if available.
- C. The Kalart Victor Warranty does not cover lamps or tubes, or the replacement of parts which become inoperative because of misuse, accident or negligence, nor if the part or parts have been repaired or altered in any way which, in our judgment, affects their condition or operation. Also, our Warranty does not cover labor charges unless the equipment is shipped pre-paid to the factory at Plainville, Conn., U.S.A.
- D. All parts taken from equipment in guarantee must be returned to the factory for inspection before "No Charge" replacements can be made. Full information must be given as to serial number, model and date of sale of said equipment.
- E. Authorization must be received from the factory before any parts or equipment may be returned for credit. A ten percent (10%) handling charge will be deducted from all credits issued for parts that have been overstocked.
- F. Minimum order - \$5.00 list. Any orders received from individuals or firms will be referred to the Kalart Victor Service Center nearest them for handling.

GENERAL INSPECTION

A general inspection will be adequate in most cases, especially where the projector has been checked periodically and its general performance known in advance. In any case, the preliminary check will soon indicate if there is any need to disassemble the projector for a more elaborate overhaul.

PROCEDURE

A. INSPECTING THE PROJECTOR

Set-up

Set the machine up as for a show and check all cords and plugs in the process. Make certain that the power cord plug is fully engaged onto amplifier male receptacle.

Belts and Pulleys

Replace belts if stretched or kinked. Check pulleys for excessive wear.

Sprockets

Make sure the sprocket guards have the proper clearance and see that the sprocket teeth are not worn. Worn and undercut teeth can be extremely damaging to film.

Rollers

Make sure all rollers are clean and revolve freely. Make a special check to see if the rollers have any flat surfaces. If so, replace.

Gate

Clean the channel and pressure plate, aperture and sound drum. Remove all encrusted emulsion. An orangewood manicure stick is very good for removing encrusted emulsion and "fuzz" from the edges and corners of the aperture. Check carefully for wear of side tension film guides and rails on which the film rides.

Lens

Clean the projection lens carefully. Use lens cleaning tissue in preference to a handkerchief although this is satisfactory if it is laundered soft and the glass not pressed hard. (Remember that optical glass is much softer than ordinary glass).

Lamphouse

Release lamphouse lock screw and remove lamphouse cover. Remove lamphouse sleeve. Clean the condenser and reflector with tissue. Make sure that condenser lens has not been disturbed on its seat in order to maintain necessary optical alignment.

Lamp

Check the lamp for excessive blackening adjacent to the condenser and reflector and wipe it clean. If the glass is blistered, or if filaments appear to sag, replace the lamp.

Motor

- a. Check the motor brush accessible from the front. If worn, remove the projector from the case and check the rear brush. Replace both if necessary.
- b. Make sure that the bearing surface of the brush is smooth and shiny. If rough and oily, the commutator needs cleaning.
- c. The commutator can be cleaned moderately well if not in bad condition by using a small piece of cheese cloth or extra fine abrasive.
- d. Care should be exercised in replacing the brushes to align concave brush surface with cylindrical surface of commutator.

Speeds

Turn the motor on, listen to the sound. Mechanism should operate at 16.7 frames per second for silent, and 24 frames per second for sound speed. (Count 84 and 120 R.P.M. of the 12 tooth feed sprocket for the 16.7 and 24 f.p.s. respectively). The operation of silent-sound and reversing switches can be determined at this time.

For sound film, the projector must run at exactly 24 frames per second. With 60 cycle A.C. supply current, a Neon lamp may be used to check for sound speed. Using a Neon light stroboscope, shade the feed sprocket from outside light. By the light of the Neon lamp the teeth of the feed sprocket will appear to stand still when the projector is running at the proper speed.

Governor

If the projector is not running at proper speed, the governor should be adjusted. Access to governor may be made by removing governor cover opening in the base of the case.

- a. First clean the contact points using ignition file, check speeds with Neon lamp. Contacts controlling the sound speed (24 frames per second) are carried on the heavier set of springs. The lighter contact springs for silent speed are marked by a red mark adjacent to adjusting screw. Turn screw clockwise to increase speed, counterclockwise to decrease speed.
- b. Adjust the governor speed controlling screw until speeds are correct.
- c. Clean the commutator ring at the back of the governor to make sure the brushes are not worn, and that they are making good contact. Space between governor brush holders and governor ring should be $1/32$ to $1/16$ ".

Clutch and Trip

The trip should operate freely. Clutch pulleys must be free and have visible end play, if end play is not visible, the clutch actuating spring may be out of position, acting against pulley rather than against the ball retainer.

Takeups

The operation of these is best checked with film threaded on the projector. Inadequate pull or jerkiness may require new belts or adjustment of the clutch pulleys.

Illumination

Turn on the lamp and make sure the illumination on the screen is uniform. (A photo-cell type exposure meter will be found useful

for this, although visual inspection will usually be satisfactory). Refer to Page 9 for lamp adjusting instructions.

Still Picture

The still picture embodies two pieces of heat absorbing glass. These may be removed for cleaning when required.

Film Scratches

Make a loop of about 36" of new (light struck) film which is very soft. Run it through the projector for several minutes. This will quickly indicate scratching caused by any element in the film path. If any abrasion marks appear, inspect each individual part of projector - (channel, pressure plate, sound core, sprockets, rollers, film shoes) for source of scratching. Check and clean very carefully.

Lubrimatic Oil System

The lubrimatic oil system is designed for maximum performance with a minimum of maintenance and attention. It is arranged to "demand feed" the shuttle cams. The wicking on the oiler tube should be positioned so that it touches only the main cam when the high lobe of the cam passes the wick. Provision for external oiling is found on the main body immediately under the rear reel arm.

B. INSPECTING THE SOUND REPRODUCTION SYSTEM

Exciter Lamp

Remove and check for excessive blackening and for sagging filament. Wipe clean and replace. Using a single frequency film, 3000 or 5000 cycle, either listen to or check output of amplifier with a db meter. Move exciter lamp in all directions to determine whether output increases. Be certain that solder contact base and socket base is clean and unoxidized, scrape or sand the contact if required.

Photocell

Remove cap, wipe clean. Correct functioning can be determined by turning amplifier volume control full on with no film in the mechanism. Photocell breakdown may also be checked by listening to a test film with another photocell in the projector. Photocells may be compared by using a standard test film and amplifier output checked with VTVM.

Tubes

While the operation of tubes can be gauged by listening to a test reel, it is preferable to remove and check all tubes in a standard tube tester. A good tester will show when a tube is near the end of its useful life. Replacement of these tubes will avoid subsequent trouble.

Fuse

The fuse is for the protection of the amplifier. A 3 ampere fuse is the maximum size to be used on the Victor amplifiers.

Test Film

Use a sound subject. The S.M.P.T.E. "Jiffy" test reel or some other good subject with which you are thoroughly familiar will enable you to quickly recognize any variation from standard which will point up need for further investigation.

Sound Quality

- a. Wows. Slow speed oscillations are usually caused by improper operation of the impedance roll assembly. Make sure that the impedance flywheel is working smoothly and the pressure roller runs free.
- b. Flutter. Relatively high speed oscillations are usually caused by improper functioning of the sound sprocket filter mechanism. Check the clearance and smoothness of the sound sprocket and its roller. (See page 11).

CLEANING THE SOUND LENS

Normal Cleaning

Remove the sound drum by pulling directly out after loosening set screw. Use pipe

cleaner to clean the film channel slot and the groove in the top of the sound lens. Also clean the lower side of the sound lens inside the sound drum. Be sure no lint remains on lens or slot. Also be sure sound drum is fully seated with slot in top position.

Hundred Hour Cleaning

Remove sound drum as above. Remove screws A and B. (Illustration I). Lift out sound channel with the sound lens assembly and place in inverted position. Next remove screws C and D (Illustration II) and lift out sound lens unit. (WARNING - Do not tamper with or loosen screw "E" which is sealed with glyptol. To do so will necessitate return of the entire assembly to the factory or nearest Victor Service Center for re-setting of lens). With a clean lintless cloth polish sound slot "F" (Illustration III) by placing cloth over thumb nail. Also polish condenser lens "G" (Illustration IV). Re-assemble sound drum in reverse order of disassembly, taking care that position of screw E is as noted in Illustration II.

Illustration I

Illustration II

Illustration III

Illustration IV

GENERAL OVERHAUL

A periodical overhauling is indicated when the equipment has been in frequent use even though the General Inspection shows that it is functioning satisfactorily. Such an overhaul may be likened to the 10, 000 and 20, 000 mile checkups on your car.

The following overhaul procedure is indicated also where there is any question about the proper performance of the projector, irrespective of the amount of use it has had.

The General Overhaul involves dismantling the projector as below:

1. Remove Projector from the Case

The projector is held in the case by four screws at the bottom of the case and two at the top. Remove tube access grill on rear of projector. Disconnect P.E.C. input. After removing the screws, slide projector forward, tilt carefully to gain access to the plugs connecting the projector to the amplifier. Disconnect these plugs and remove the projector.

2. Remove the Lamphouse

Loosen lamphouse cover lock screw. Remove lamphouse cover, remove lamp baffle assembly, remove lamp. This exposes the greatest part of the mechanism for adjustment. If further disassembly is necessary, insert allen wrench into opening of fan housing and loosen fan screw. Remove four screws holding lamphouse base assembly to the main casting of projector. Loosen two screw holding wires in the terminal board under the impedance flywheel, and remove "C" washer holding rewind pulley. Remove casting assembly allowing the fan to lie inside of the fan housing.

3. Remove the Motor

This is necessary only when the commutator or bearings need attention. The motor armature, 47661, should be checked when giving the projector a complete overhaul. The commutator can be turned on a lathe. Care should be exercised to remove a minimum amount of material from the commutator for if the cut taken is too deep, the armature will not operate satisfactorily and should be replaced.

Under the following headings are given the steps most often necessary for properly checking the projector mechanism. Owing to the extreme accessibility of the mechanism, replacements even of vital parts are easy and positive.

4. Shuttle

Part 48016-A is the heart of the entire mechanism and must be checked carefully.

- a. Check cam follower, 47531, for wear on both the main cam and oscillator cam wear surfaces.
- b. Check pawls for wear or roughness. Ascertain proper mounting of sapphire tip. Sapphire tip should show no signs of "grooving". If necessary, minor rough spots on the steel shuttle pawl may be "stoned" smooth provided care is used.
- c. Check ball seat of shuttle to ascertain excessive wear. Felt pad, 47633, must be oily at all times.
- d. When installing a new shuttle, the oscillating sleeve and hub assembly, 47520-A, should be adjusted to allow the shuttle teeth in their pulldown position, to extend through the film channel 1/16". This adjustment of moving the oscillating assembly can be made by using tool, T-9159. Make sure that shuttle spring, 47638, is adjusted to seat properly against the cam follower.

In the event of any question of the best functioning of this vital part, replace the entire shuttle to circumvent subsequent complaints.

5. Drive Belts

"O" Ring drive belt, 47609, and flat belt, 47610, should be checked and replaced if they show signs of wear.

6. Belt Idler

Remove pulley by removing "C" washer, see that bearing is held tight by push on fastener. Soak felt wick in oil and

replace onto bearing making certain that felt rests on the oilite surface and is spaced away from the Idler plate. Reassemble.

7. Safety Shutter

If a dark shadow appears either at the top or bottom of the screen, the fire shutter, 47695-A, is out of adjustment and the shutter aperture must be aligned with the optical centerline. This is done by adjusting the eccentric on the screw holding the safety shutter lever directly over the center of the motor. This adjustment raises or lowers the fire shutter in relation to the main aperture. Make certain that the shutter slides quite freely between the guides, 19471, so that when mechanism is tripped it will drop of its own weight.

8. Flywheel Units

The necessary end play for flywheel shafts is .004. Occasionally this tolerance will need adjusting. Use a feeler gage to check this. In the absence of a feeler gage, a single film thickness (.006) is satisfactory for this adjustment. Do Not tighten up end play too close to the bushing or too much drag will occur. This is worse than if they were a bit loose. The filter fly-wheel 47223A should be checked to make certain that the filter springs are not touching the gear assembly. This would result in an uneven action and poor sound reproduction. One of the filter springs is straight while the other one has a small bend or angle.

9. Takeup Pulleys

Uneven action of the takeup pulleys causes jumpy action of the takeup and may result in the film "spilling over". This uneven action, in turn, may be caused by wear or oil and grease in the assembly. The takeup clutch assembly 26836A should be checked to see if it is working correctly and is clean. This assembly must be removed from the projector to disassemble. Extreme caution should be exercised in taking this assembly apart so that the clutch actuating spring and the small clutch balls will not become lost. It may be reassembled dry or with light oil.

Carbon tetrachloride may be used to clean it. In reassembling, care should be taken to have the clutch actuating spring engage the ball retainer, and when assembled the spring should have no lateral pressure on the pulley. This can be determined by ascertaining the "free" end play of the pulleys.

10. Governor

Occasionally the brushes need replacement. (The governor itself rarely needs replacement).

To remove the governor, first remove the end plate and speed switch from the motor housing. Then loosen the locking screw on the governor hub and slide off the motor shaft.

- a. The motor governor 47745 should be checked to make certain that the points are smooth. If the points are found rough or pitted, a regular point file should be used.
- b. The governor rings can be polished if mounted on a 1/4" arbor either in a lathe or drill press.
- c. When replacing the governor be sure that there is at least 1/16" clearance between the governor brush holders and the governor.
- d. The set of contacts marked with red is used for controlling the silent speed, the unmarked (and stiffer) contacts are used for adjusting sound speed.

11. Film Shoes—Upper and Lower

Film shoes should be properly adjusted to drive sprocket. Clearance between shoe and sprocket should be .009 to .015 or 1 1/2 to 2 1/2 film thicknesses.

12. Feed Sprocket

Part #36154 should be checked after excessive use for grooves in the sprocket teeth which will result in film noise. If this should occur, sprocket should be replaced holding .004" end play.

13. Sound Sprocket

The teeth of the soundsprocket #30368-A will also become grooved after extensive use which will result both in noise and flutter in sound reproduction. This should also be replaced when sprocket is worn.

14. Hand Control Shaft

The hand control shaft 48003-A requires a little grease in the slotted shaft end and oil on the bearing area. This shaft should be checked when the projector is given a complete overhaul.

15. Film Channel Clips

#19316 should be cleaned thoroughly and checked for wear to make certain they are functioning properly. If necessary to replace the clips, unscrew the four screws holding the film channel and remove clips.

To reinstall, place film channel beneath the film tension clip spring. Hold one film channel clip in each hand and place the clips over clip tension spring. Move these into position on casting, holding in this position with index fingers.

With thumb of each hand slide the film channel into position and reassemble four holding screws. Side tension of clips should not exceed 1 3/4 oz.

16. The Film Channel

47519 should be checked for worn rails, if these show wear, the channel should be replaced.

17. Pressure Plate

The Pressure Plate 47502A used on earlier models should provide a tension of approximately 4 oz. Pressure Plate 48022A used on later models should provide a tension of approximately 3 oz. - but not to exceed 4 oz. If too much tension is applied it will result in excessive shuttle pawl wear and loss of loop when running new film.

18. Lens Mount

The Lens mount may be aligned to correct a picture that is out of focus on one side by adjusting the lens mount stop screw #19301, located under and to the inside of the lens mount.

19. Lamp Adjusting Nut

When replacing projection lamp, if shaded areas or banding of light is in evidence on the screen, this would indicate that the projection lamp is not in correct alignment. This can be corrected by loosening the Hex nut under lamp socket and moving socket from side to side as required to clear up dark areas. The nut, directly under the lamp socket can be reached with a 3/8" box wrench through front of lamp house casting after removing lamp house name plate.

20. Projection Lamp

The projection lamp should be replaced after excessive darkening of inside of lamp envelope. This darkening causes loss of light and formation of blisters on envelope in line with filaments. It is good practice to allow motor to run for a few minutes after the lamp has been turned off to cool the lamphouse and the lamp.

21. Projection Lamp & Motor Switches

Circuitry is arranged so that motor switch must be turned on before lamp can be turned on.

22. Oscillating Gear Assembly

The oscillating gear assembly, 47520A, should be checked for wear making certain there is not over .003" end play as this assembly controls action of the shuttle.

23. Exciter Lamp

If the exciter lamp, 19299, lights intermittently, check for corroded contact on the lamp socket base. This can be quickly corrected by scraping base clean with sharp tool or polishing it with a piece of emery cloth. See page 5, paragraph B.

24. Impedance Loop Roll Assembly

Inspect impedance Loop Roll Assembly part 30369A for uneven wear or flats.

Assembly should spin easily with minimum end play of .002 to .005.

25. Timing the Projector

Remove head from $3/56 \times 7/8$ lg. screw, leaving screwdriver slot to use as pilot and insert into one hole in oscillator. Assemble oscillator cam with hole in center of shear form onto this screw, add spacer, assemble main cam with hole at sharp radius onto this screw, add spacers as required to allow shutter to clear framing mechanism.

Assemble shutter onto screw with witness mark blade at aperture and with location of blades as shown.

When the shuttle is in the top of its pulldown position, the shutter blade with witness mark must cover the aperture. This applies to both two interruption and three interruption units. In changing from Mark II to Mark III care should be exercised in retaining shutter and cam combination in pairs as these are balanced as a set. If travel ghost appears at the top of the picture the shutter is following and should be rotated clockwise slightly with respect to the cam. Tighten (3) screws to keep shutter blade from shifting.

MARK II SHUTTER
(2 Interruption)

MARK III SHUTTER
(3 Interruption)

TOLERANCES

30369-A	Impedance Roll (end play)	.002 to .005
30368-A	Sound Sprocket (end play)	.001 to .004
26836A	Feed Sprocket Clutch and Shaft Assembly (end play)	.001 to .004
47520A	Oscillating Gear Assembly (end play)	.001 to .003
47745	Governor Setting 1/16" clearance between Brush Holders and Commutator	
47502-A	Aperture Plate (Float) .020" Side to Side, 1/32" in and out, tension not to exceed 4 oz.	
48022	Aperture Plate tension not to exceed 4 oz.	
48017-A	Shuttle Pawls extend through Film Channel 1/16" Distance between upper and lower pawl .272	
47638	Spacing between under side of spring and casting to be 3/8"	

NOTE: Single Film Thickness is .006 inches, in the absence of proper thickness gage. A single film thickness may be used for making field adjustments for end play.

Some Possible Projector Troubles and their Remedies

1. Premature Lamp Blow Out

a. High Line Voltage:

This is nearly always the cause of the trouble. Check line with a good meter. The power companies often boost the supply voltage to compensate for heavy loads in outlying districts. Voltages also tend to vary with the general industrial load and may vary greatly in different parts of the same area at the same time.

b. Incorrect Lamp Used:

The lamps usually stocked by the

dealer are rated for 110 volts and are suitable for line voltages of from 100 volts to 115 volts. While they can be used on 120 volt lines, their life will be curtailed, especially the ten hour lamps.

Lamps rated at 100 V, 105 V, 115 V, 120 V, and 125 V can be obtained on order. (Use of a low voltage rated lamp increases illumination at the expense of lamp life). Occasionally we run into line voltages of 130 and 135 volts. Obviously, even a 125 volt lamp will burn out on such a line.

2. Main Line Fuse Blows

This indicates a short or ground in the wiring. Test the projector and amplifier separately. Localize the fault by disconnecting motor, lamp, governor, etc., as necessary until the faulty part is found.

3. Motor Will Not Run

- a. Check cords and plugs.
- b. Check motor brushes.
- c. Check main switch contacts.
- d. Check governor brushes and contacts.
- e. Check line fuse.

4. Speed Variation

Clean governor contact points and readjust setting if necessary.

5. Loss of Top Loop

Check for:

- a. Improper seating of upper film shoe.
- b. Torn film perforations.

6. Loss of Lower Loop

Check for:

- a. Torn film perforations.
- b. Film not threaded properly at gate.
- c. Film shoes and gate clearance.
- d. Excessive wear of shuttle.

7. Film Scratches

This is usually due to an accumulation of hardened emulsion on aperture plates or film channel because these parts have not been kept clean. It may also be due to physical damage to extremely smooth surface of gate plates or wear of guides on back film channel, aperture plate, or sound drum. If so, replacement is indicated.

8. Pictures Unsteady

- a. Film badly shrunken and perforations chipped.
- b. Wear on shuttle or other parts of intermittent mechanism.
- c. Pressure plate not properly seated in film channel.

9. Flicker

- a. Governor set too slow.
- b. Cam gear replaced "out of time."
- c. Light shutter "out of time."

10. Film Spills Over

- a. Insufficient friction on feed spindle.
- b. Worn takeup clutch.
- c. Rewind belt not in place on reel arm.

11. "Motor-Boating"

- a. Sound drum not replaced properly, causing film misalignment.
- b. Impedance roll sticking.
- c. Weak photocell.

12. Film Tears at Drive Sprocket

- a. If sprocket is replaced without hardened thrust washer between it and the casting, the sprocket teeth will not align with groove of idler rollers.
- b. Film shoes too tight. Adjust with 2 thicknesses of film.

13. Film Perforations Chip

- a. Worn sprocket teeth.
- b. Worn shuttle or shuttle teeth.
- c. Tension at gate insufficient.
- d. Badly shrunken film.

14. Insufficient Light on Screen

- a. Dirty lens, condenser, or reflector.
- b. Lamp old, blackened or dirty.
- c. Low line voltage.
- d. Dirty screen.
- e. Lamp improperly seated.

15. Picture Partly Out of Focus

- a. Aperture plate improperly aligned - must be parallel to film channel.

- b. Too little tension at gate allows film to move in and out of focus.
- c. Dirt on lens.
- d. Projector not at 90° angle with screen.

16. Travel Ghost

A picture with a streaked effect, particularly on white scenes, is caused by light shutter not properly timed.

Possible Amplifier Troubles and their Remedies

1. Hum

- a. Shield off of 1st stage or tube or P. E. Cell.
- b. Check all condensers, particularly filter condensers.
- c. Check phone and mic. jack.

2. Noise

- a. Try reversing plug in power supply line.
- b. Check speaker cord and connections.
- c. Defective or microphonic 1st stage tube. Try one or two other tubes.
- d. A loose connection, particularly in the plugs connecting to the projector.
- e. Check resistors.
- f. Check condensers.

3. Low Volume

- a. Defective tubes, P. E. Cell, or exciter lamp.
- b. Make certain exciter lamp is aligned with slit.

- c. Dirt or oil on optical slit or lens.
- d. Low line voltage.

4. No Sound Response

- a. Check power source, cords, etc. Check fuse (see items listed under FUSE).
- b. Check output transformer, speaker, etc.
- c. Check speaker for ground, short, or open circuit.
- d. Check amplifier tubes to see if filaments are lit and seat them properly.
- e. Check exciter lamp, if burned out.

5. Fuse

- a. Blows as power is switched on - probably a short in power transformer.
- b. If amplifier warms up and then fuse blows, check the rectifier and output tubes and then the filter condensers.

NOTES

TECHNICAL DATA

PROJECTOR

105/130 Volts 50/60 Cycles A.C.

Power Cord: 2 Conductor 12 ft., 16 ga.
3 Conductor 12 ft., 16 ga.
Grounding Adapter

VAC #20632
VAC #47750
VAC #47687

FILM SPEED

24 frames per second Sound
16.7 frames per second Silent

FILM CAPACITY

2000 ft. reels maximum

PHOTO CELL

RCA 927 or equiv.

VAC #19210

PROJECTION LAMP

750 Watt Standard DDB (25 hour)
1000 Watt (Optional) DFD (10 hour)
1200 Watt (Optional) DHT (10 hour)

VAC #47125
VAC #47130
VAC #47316

EXCITER LAMP

6.5A/T8/ISCP (BVK)

VAC #19299

AMPLIFIER

Power required

105 to 130 Volts 50/60 cycles

TUBE COMPLEMENT

Voltage Amplifier
Amplifier Phase Inverter
Output (2 tubes)
Rectifier
